Currency risk

The Company performs its activities with an active exchange with foreign suppliers and clients. Therefore, it is exposed to currency risk mainly in respect of USD. The Company supplies part of its raw and other materials in USD. The currency risk is related with the adverse floating of the exchange rate of USD against BGN in future business transactions as to the recognised assets and liabilities denominated in foreign currency and as to the net investments in foreign companies. The remaining part of Company operations are usually denominated in BGN and/or EUR. The Company sells some of its finished products in Russia in euro and thus eliminates the currency risk associated with the depreciation of the Russian ruble in the recent months. The accounts with subsidiaries in Ukraine are also denominated in euro. However, in connection with the instability in the country and the continued depreciation of the Ukrainian hryvnia, in order to minimize currency risk, the company conducts through its subsidiaries a currency policy, which includes the implementation of advance payments and shortening of the periods of delayed payments and immediate exchange of revenues in local currency in euros, as well as raising of the price mark-ups on products in order to compensate for possible future devaluation of the hryvnia. To control foreign currency risk, the Company has introduced a system for planning import supplies, sales in foreign currency as well as procedures for daily monitoring of US dollar exchange rate movements and control on pending payments.

Credit risk

Credit risk is the risk that any of the Company's clients will fail to discharge in full and within the normally envisaged terms the amounts due under commercial receivables. The latter are presented in the statement of financial position at net value after deducting the impairment related to doubtful and bad debts. Such impairment is made where and when events have existed identifying loss due to uncollectability as per previous experience.

In the years of its trade experience, the Company has implemented different schemes of distribution to reach its efficient approach of today, in conformity with the market conditions, using various ways of payment as well as relevant trade discounts. The Company works on its main markets with counterparts with history of their relations on main markets, which include over 70 licensed Bulgarian and foreign traders of pharmaceuticals.

The cooperation with the National Health Insurance Fund and the state hospitals also require the implementation of deferred payments policy. In this sense, regardless of credit risk concentration, it is controlled through the choice of trade counterparts, current monitoring of their liquidity and financial

stability as well as direct communication with them and search of prompt measures on first indications for existing problems.

Liquidity risk

Liquidity risk is the adverse situation when the Company encounters difficulty in meeting unconditionally its obligations within their maturity.

The Company generates and maintains a sufficient volume of liquid funds. An internal source of liquid funds for the Company is its main economic activity generating sufficient operational flows. Banks and other permanent counterparts represent external sources of funding. To isolate any possible liquidity risk, the Company implements a system of alternative mechanisms of acts and prognoses, the final aim being to maintain good liquidity and, respectively, ability to finance its economic activities. This is complemented by the monitoring of due dates and maturity of assets and liabilities as well as control of cash outflows.

Risk of interest-bearing cash flows

Interest-bearing assets are presented in the structure of Company's assets by cash and loans granted, which are with fixed interest rate. On the other hand, Company's borrowings in the form of long-term and short-term loans are usually with a floating interest rate. This circumstance makes the cash flows of the Company partially dependent on interest risk. This risk is covered in two ways:

- a) optimisation of the sources of credit resources for achieving relatively lower price of attracted funds;
- b) the combined structure of interest rates on loans, which consists of two components – a permanent one and a variable one, the correlation between them, as well as their absolute value, can be achieved and maintained in a proportion favourable for the Company. The permanent component has a relatively low absolute value and sufficiently high relative share in the total interest rate. This circumstance eliminates the probability of a significant change in interest rate levels in case of variable component updating. Thus the probability for an unfavourable change of cash flows is reduced to a minimum.

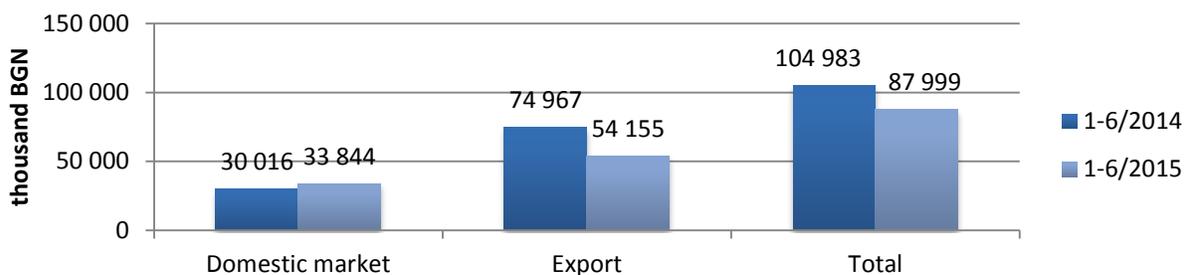

The Company's management currently monitors and analyses its exposure to changes in interest rates. Various scenarios are simulated taking into consideration refinancing, renewal of existing positions, and alternative financing. Based on these scenarios, the impact of a defined interest rate shift, expressed in points or percentage, on the financial result and equity is calculated. For each simulation, the same assumption for interest rate shift is used for all major currencies. The calculations are made for major interest-bearing positions.
